SALES DATA

SQL Analysis Project

Global Sales Dataset | 2010–2024 | African Market Focus by KN Kgetjepe

14 Years	4 X-Models	2 Analyses	1 Market
Of Data	Analyzed	Core Studies	Africa

01 | About This Project

This project documents a professional SQL data analysis performed on BMW's global sales data set spanning from 2010 to 2024. The analysis focuses on two critical business questions every automotive company needs to answer — how much revenue are we generating, and how sensitive are our customers to price changes?

Using SQL techniques including window functions, stored procedures, and calculated fields, we extract actionable insights that directly inform BMW's pricing strategy and market investment decisions — with a specific focus on the African market.

Business Problem

BMW's African regional sales division reported a sustained decline in X-class vehicle sales between 2010 and 2024. Regional executives required a data-driven SQL investigation to determine whether declining sales were caused by pricing decisions, market conditions, or model-specific under-performance and to recommend a corrective data strategy.

Key Questions This Analysis Answers

1. Which BMW X-class model is generating the most revenue in Africa?
2. Have price increases contributed to the sales volume decline?
3. Are African buyers price sensitive or driven by brand prestige?
4. Which model should BMW prioritize to reverse the sales decline?

Project Scope

Dataset	`bmw sales data (2010-2024)`
Region Filter	Africa
Models in Scope	M(3/5) & I(3/8) & X(1/3/5/6) & (3,5,7)SERIES
Time Period	2010 – 2024 (14 years)
Key Columns	model, year, region, price_usd, sales_volume, sales_classification, transmission, fuel_type
Tool	MySQL Workbench

SQL Techniques Used

SELECT & Filtering	Precise data extraction with WHERE clauses and column aliases
Window Functions	LAG() with PARTITION BY for year-over-year comparisons
Stored Procedures	Reusable query logic with DROP, CREATE, BEGIN/END blocks
Calculated Fields	Derived metrics: total_revenue, price_change_pct, volume_change_pct
Aggregation	SUM(), GROUP BY for executive summary reporting
Data Formatting	ROUND() for clean, presentation-ready numeric output

02 | Query #001 — BMW X-Class Stored Procedure

A stored procedure that encapsulates multiple SELECT queries for BMW's Car mode lineup . Instead of running separate repetitive queries, analysts can easily execute a single CALL statement that returns any required table result by model instantly.

```sql
-- GROUPED DIFFERANT TABLES BY FILTERING THE CAR CLASS MODEL AND RANGE FOR BMW 2010-2024

-- BMW SERIES CLASS TABLES
drop procedure if exists bmw_series_class;
delimiter //
create procedure bmw_series_class ()
begin
select* from bmw.`bmw sales data (2010-2024)` where model = '3 Series';
select* from bmw.`bmw sales data (2010-2024)` where model = '5 Series';
select* from bmw.`bmw sales data (2010-2024)` where model = '7 Series';
end //
delimiter ;
call bmw_series_class();
```

```sql

-- BMW M TABLE
drop procedure if exists bmw_M_class;
delimiter //
create procedure bmw_M_class ()
begin
select* from bmw.`bmw sales data (2010-2024)` where model = 'M5';
select* from bmw.`bmw sales data (2010-2024)` where model = 'M3';
end //
delimiter ;
call bmw_M_class ()
```

Set limit for number of rows returned by queries.
Workbench will automatically add the LIMIT clause with the configured number of r

```sql

-- BMW I CLASS TABLES
drop procedure if exists bmw_I_class;
delimiter //
create procedure bmw_I_class ()
begin
select* from bmw.`bmw sales data (2010-2024)` where model = 'I3';
select* from bmw.`bmw sales data (2010-2024)` where model = 'I8';
end //
delimiter ;
call bmw_I_class ();
```

- Helps analyze a tables set by different products which makes it easier for analyst to select any table sets by vehicle models.
- Time is saved by using call to work with data instead of using select to retrieve data.
- Easier to update data or make the changes on the right data which is also most suitable for consistency.
- It is secured to use because use can be granted without giving full access which helps protect raw data.

```sql
-- BMW X CLASS TABLES
drop procedure if exists bmw_x_class ;
delimiter //
create procedure bmw_x_class()
begin
select* from bmw.`bmw sales data (2010-2024)` where model = 'X1';
select* from bmw.`bmw sales data (2010-2024)` where model = 'X3';
select* from bmw.`bmw sales data (2010-2024)` where model = 'X5';
select* from bmw.`bmw sales data (2010-2024)` where model = 'X6';
end //
delimiter ;
call bmw_x_class();
```

03 | Query #002 — Africa Revenue Trend Analysis

This query pulls all BMW Africa sales data and adds a derived total_revenue column calculated by multiplying price by sales volume. Results are sorted chronologically by year, then by sales classification and volume — giving executives a ranked performance report for the African market.

```sql
-- BMW Sales Revenue for each region 2010-2024
select *,(price_usd*sales_volume) as total_revenue
from bmw.`bmw sales data (2010-2024)`
where region = 'Africa'
order by year,total_revenue
;
-- Revenue Table on Vehicles with Manual transmitions in Africa
select *,(price_usd*sales_volume) as total_revenue
from bmw.`bmw sales data (2010-2024)`
where region = 'Africa'
having transmission = 'manual'
order by year,total_revenue;
```

```sql
-- Revenue Table on Vehicles with Manual transmitions and Hybrid fuel type in Africa
select *,(price_usd*sales_volume) as total_revenue
from bmw.`bmw sales data (2010-2024)`
where region = 'Africa'
having transmission = 'manual' and fuel_type = 'hybrid'
order by year,total_revenue;
```

- Helps analyze which model / year generated the most revenue which can also highlight business demand.

- Helps analyze how revenue has grown and declined over the year for Africa.
- Helps identify which model to focus on for marketing strategies to drive sales on each region.

04 | Query #003 — Price Elasticity of Demand

The most advanced query in this project. Using the LAG() window function partitioned by model, we compare each year's price and sales volume to the previous year — calculating percentage changes that reveal how price-sensitive BMW Africa buyers are across each vehicle model.

```sql

-- Price Elasticity of Demand for BMW X-Class Models (2010-2024)
SELECT
    model,
    year,
    price_usd,
    sales_volume,
    lag(price_usd) over (partition by model order by year) AS prev_price,
    lag(sales_volume) over (partition by model order by year) as prev_sales_volume,
    ROUND(((price_usd - lag(price_usd) OVER (partition by model order by year))
        / lag(price_usd) over (partition by model order by year)) * 100, 2) as price_change_percentage,
    ROUND(((sales_volume - lag(sales_volume) over (partition by model order by year))
        / lag(sales_volume) over (partition by model order by year)) * 100, 2) as volume_change_percentage
from bmw.`bmw sales data (2010-2024)`
where Region = 'Africa'
order by model, year ASC;

```

- Helps identify price sensitivity effect between the price change and volume change for each Region
- Helps know which models are price sensitive vs prestige driven where buyers are less discouraged by high prices
- Guiding future pricing strategy — whether to discount, hold, or premium price each model

05 | How to Read the Results

When the Price Elasticity query runs, results fall into four scenarios. Here's how to interpret each one and what action BMW should take:

#	Price Change	Volume Change	Meaning	BMW Action
1	Price UP	Volume DOWN	Customers are price sensitive	Stop raising prices in Africa

2	Price UP	Volume UP	Prestige effect — luxury signal	Maintain premium pricing strategy
3	Price DOWN	Volume UP	Discounting is driving demand	Run more promotions to boost volume
4	Price DOWN	Volume DOWN	External factors suppressing sales	Investigate competition & economy

07 | Business Recommendations

Freeze Price Increases

African buyers show strong price sensitivity — especially post-2020.

Introduce Entry Financing

High price sensitivity signals an affordability barrier. Partnering with African financial institutions to offer low-deposit financing could unlock a significant untapped buyer segment.

Investigate Post-2019 Drop

The sharpest volume declines occurred from 2020 onward. A deeper analysis factoring in GDP growth, fuel prices, and competitor activity in key African markets is recommended.

08 | Executive Summary

This project demonstrates the ability to translate a real-world business problem into structured SQL queries — progressing from basic filtering and stored procedures to advanced window functions that produce actionable business intelligence.

The two core analyses — Revenue Trend Analysis and Price Elasticity of Demand — answer the two most important questions any automotive regional team needs: Are we pricing right? And which models are truly worth investing in?

Revenue Trend Analysis

Identifies top-performing models and tracks how BMW Africa's revenue has grown or declined across 14 years.

Price Elasticity of Demand

Reveals how sensitive African BMW buyers are to price changes — enabling smarter, data-driven pricing decisions.

09 | Table Created View

```sql
-- Price Elasticity of Demand for BMW X-Class Models (2010-2024)
SELECT
    model,
    year,
    price_usd,
    sales_volume,
    lag(price_usd) over (partition by model order by year) AS prev_price,
    lag(sales_volume) over (partition by model order by year) as prev_sales_volume,
```
